

# Teaching Manual: Two-Step Problems With Four Operations

Scripted lesson | 60-75 minutes

## LESSON OVERVIEW

**Learning goal: Represent and solve two-step problems using all four operations.**

### Success Criteria

- The student represents the idea with a model, drawing, table, or number line.
- The student uses the lesson vocabulary accurately.
- The student explains why a strategy works and checks reasonableness.
- The student can respond independently to: Circle the intermediate answer in one completed problem and state what it means.

### Teaching Theory

Properties describe why equivalent expressions keep the same value. Variables represent unknown quantities, and the equal sign states that two expressions have the same value.

**Instructional principle:** Move concrete -> pictorial -> abstract. Do not remove the model until the student can explain the symbolic work.

### Lesson Flow

|         |                               |
|---------|-------------------------------|
| 5-8 min | Number talk                   |
| 10 min  | Vocabulary and worked example |
| 20 min  | Main lesson                   |
| 15 min  | Practice                      |
| 10 min  | Challenge                     |
| 5 min   | Exit check                    |

# Materials: Preparation and Use

## BEFORE THE STUDENT ARRIVES

|                                 |                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Problem-solving notebook</b> | Place beside the student. Use for drawings, organized records, and a second representation.     |
| <b>highlighters</b>             | Prepare before the lesson and introduce it only when it supports the current mathematical idea. |
| <b>bar-model paper.</b>         | Place beside the student. Use for drawings, organized records, and a second representation.     |

### Table Setup

- Center: the main model or tool for today's lesson.
- Student side: packet, pencil, and only the materials currently needed.
- Teacher side: answer notes and observation record, kept out of student view.
- Leave a clear space where the student can point, move pieces, and explain.

### Vocabulary to Establish

**expression:** Ask the student for an example or picture before refining the definition.

**equation:** Ask the student for an example or picture before refining the definition.

**variable:** Ask the student for an example or picture before refining the definition.

**equal:** Ask the student for an example or picture before refining the definition.

**distributive property:** Ask the student for an example or picture before refining the definition.

**area model:** Ask the student for an example or picture before refining the definition.

**Material rule:** The student should touch, draw, measure, or organize the mathematics before copying a procedure.

# Phase 1: Launch and Number Talk

## EXACT TEACHER LANGUAGE

|              |                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Teacher says | "Today we are learning to represent and solve two-step problems using all four operations. Before I show a method, I want to hear how you see the numbers." |
| Why          | Positions the student as a mathematical thinker and makes prior knowledge visible.                                                                          |
| Listen for   | Useful representations, precise vocabulary, and whether the student checks reasonableness.                                                                  |
| Then do      | Acknowledge the idea neutrally, then ask for evidence rather than immediately evaluating it.                                                                |

## Number Talk Prompt

|              |                                                                                            |
|--------------|--------------------------------------------------------------------------------------------|
| Teacher says | "A box holds 8 rows of 6 pencils. Twelve pencils are used. What must be calculated first?" |
| Why          | Surfaces the relationships needed in the main lesson.                                      |
| Listen for   | Any reasoning connected to properties and algebraic thinking, not only a final answer.     |
| Then do      | Ask: 'Can you show that another way?' Record two distinct strategies when possible.        |

## Prompt Ladder

|                                                                                |
|--------------------------------------------------------------------------------|
| <b>First:</b> What do you notice? What could you try?                          |
| <b>Next:</b> Can you draw, build, or organize the information?                 |
| <b>Then:</b> Which part of today's vocabulary fits your idea?                  |
| <b>Last resort:</b> Solve a smaller related case, then return to the original. |

# Phase 2: Explicit Teaching

## MODEL, QUESTION, CONNECT

### Teaching Step 1

|                     |                                                                           |
|---------------------|---------------------------------------------------------------------------|
| <b>Teacher says</b> | "Let us retell. Tell me what I should do first and why."                  |
| <b>Why</b>          | Keeps the student cognitively active during explicit instruction.         |
| <b>Listen for</b>   | A connection between the representation and the mathematical symbols.     |
| <b>Then do</b>      | Model only the next move. Pause and return responsibility to the student. |

### Teaching Step 2

|                     |                                                                                 |
|---------------------|---------------------------------------------------------------------------------|
| <b>Teacher says</b> | "Let us identify quantities and units. Tell me what I should do first and why." |
| <b>Why</b>          | Keeps the student cognitively active during explicit instruction.               |
| <b>Listen for</b>   | A connection between the representation and the mathematical symbols.           |
| <b>Then do</b>      | Model only the next move. Pause and return responsibility to the student.       |

### Teaching Step 3

|                     |                                                                             |
|---------------------|-----------------------------------------------------------------------------|
| <b>Teacher says</b> | "Let us draw a bar model or array. Tell me what I should do first and why." |
| <b>Why</b>          | Keeps the student cognitively active during explicit instruction.           |
| <b>Listen for</b>   | A connection between the representation and the mathematical symbols.       |
| <b>Then do</b>      | Model only the next move. Pause and return responsibility to the student.   |

### Teaching Step 4

|                     |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| <b>Teacher says</b> | "Let us identify the intermediate question. Tell me what I should do first and why." |
| <b>Why</b>          | Keeps the student cognitively active during explicit instruction.                    |
| <b>Listen for</b>   | A connection between the representation and the mathematical symbols.                |
| <b>Then do</b>      | Model only the next move. Pause and return responsibility to the student.            |

## Teaching Step 5

|              |                                                                                   |
|--------------|-----------------------------------------------------------------------------------|
| Teacher says | "Let us write equations with an unknown. Tell me what I should do first and why." |
| Why          | Keeps the student cognitively active during explicit instruction.                 |
| Listen for   | A connection between the representation and the mathematical symbols.             |
| Then do      | Model only the next move. Pause and return responsibility to the student.         |

## Teaching Step 6

|              |                                                                           |
|--------------|---------------------------------------------------------------------------|
| Teacher says | "Let us solve and check. Tell me what I should do first and why."         |
| Why          | Keeps the student cognitively active during explicit instruction.         |
| Listen for   | A connection between the representation and the mathematical symbols.     |
| Then do      | Model only the next move. Pause and return responsibility to the student. |

**Representation check:** Before leaving the model, ask the student to point to every part of the matching equation or statement.

# Phase 3: Guided and Independent Practice

## RELEASE RESPONSIBILITY GRADUALLY

### I Do -> We Do -> You Do

- I do: complete the packet's worked example while narrating the reason for each move.
- We do: solve the first practice task together; the student chooses the representation.
- You do: the student completes the remaining tasks while explaining selected answers.

|              |                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------|
| Teacher says | "Practice task 1: Multiply, then subtract. Before solving, tell me what the task is asking and which tool might help." |
| Listen for   | Correct interpretation before computation.                                                                             |
| Then do      | Use the prompt ladder. Avoid completing a step the student can perform.                                                |

|              |                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------|
| Teacher says | "Practice task 2: Add, then divide. Before solving, tell me what the task is asking and which tool might help." |
| Listen for   | Correct interpretation before computation.                                                                      |
| Then do      | Use the prompt ladder. Avoid completing a step the student can perform.                                         |

|              |                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------|
| Teacher says | "Practice task 3: Divide, then multiply. Before solving, tell me what the task is asking and which tool might help." |
| Listen for   | Correct interpretation before computation.                                                                           |
| Then do      | Use the prompt ladder. Avoid completing a step the student can perform.                                              |

|              |                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Teacher says | "Practice task 4: A problem with an unknown starting amount. Before solving, tell me what the task is asking and which tool might help." |
| Listen for   | Correct interpretation before computation.                                                                                               |
| Then do      | Use the prompt ladder. Avoid completing a step the student can perform.                                                                  |

### Common Misconceptions

**Watch for:** Reading the equal sign as 'the answer comes next.'

**Watch for:** Believing a variable always has the same value.

**Watch for:** Breaking apart one factor but failing to include every part.

## Differentiation

**Secure:** Remove routine repetition and ask for a second method, proof, or generalization.

**Developing:** Keep the visual model visible and reduce the number size while preserving the same structure.

**Fragile:** Return to a concrete example, use one question at a time, and delay independent symbols.

# Phase 4: Challenge, Assessment, and Feedback

## PROTECT PRODUCTIVE STRUGGLE

|              |                                                                                                                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Teacher says | "Challenge: Write and solve a two-step problem that uses both division and addition and has answer 35. You may draw, make a table, test a simpler case, or work backward. I will give you thinking time before offering a hint." |
| Why          | Builds persistence and strategy selection rather than rapid answer production.                                                                                                                                                   |
| Listen for   | An organized plan, revision after a failed attempt, and a justification.                                                                                                                                                         |
| Then do      | Praise a specific mathematical action: organization, checking, representation, or explanation.                                                                                                                                   |

## Exit Check

|              |                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------|
| Teacher says | "Complete this independently: Circle the intermediate answer in one completed problem and state what it means." |
| Why          | Provides evidence of the central lesson goal without teacher prompting.                                         |
| Then do      | After completion, ask one clarifying question only if the written reasoning is ambiguous.                       |

## Evidence Guide

|            |                                           |                                                                        |
|------------|-------------------------------------------|------------------------------------------------------------------------|
| Secure     | Correct and independently justified       | Proceed; add a variation or ask the student to teach the idea.         |
| Developing | Correct with model or prompt              | Proceed with the model available and begin next lesson with retrieval. |
| Fragile    | Incorrect structure or unexplained answer | Reteach with smaller quantities and a concrete representation.         |

# Answer and Observation Guide

## USE AFTER INDEPENDENT WORK

### Expected Mathematical Evidence

- Number talk: a defensible response to 'A box holds 8 rows of 6 pencils. Twelve pencils are used. What must be calculated first?' with a model or explanation.
- Main lesson: evidence that the student can represent and solve two-step problems using all four operations.
- Practice: accurate work with units, labels, and a reasonableness check where appropriate.
- Challenge: an organized attempt at 'Write and solve a two-step problem that uses both division and addition and has answer 35.' and an explanation of the chosen strategy.
- Exit: an independent response to 'Circle the intermediate answer in one completed problem and state what it means.'

### Teacher Verification Routine

- Rework every numerical answer before marking it.
- Accept a different method when the reasoning is valid.
- For open problems, verify that every condition is satisfied.
- For measurement, data, and geometry, require correct units and labels.
- For explanations, distinguish a correct statement from a demonstrated reason.

### Observation Record

**A strong strategy the student used:**

---

---

**A misconception to revisit:**

---

---

**Vocabulary used precisely:**

---

---

**Material or representation that helped:**

---

---

**Plan for the next lesson:**

---

---
